MediaLedger

Release History

Every release, and what each one added, changed and fixed

Version	Build date	Document date
3.0.0	2026-10-12	2026-10-11

51 releases, from 0.1.0 on 2026-09-05 to 3.0.0 on 2026-10-12.

Written from the project change log (CHANGELOG.md) and the release commits. Newest first.

7.10 Version 0.3.0, 2026-09-05 26
7.11 Version 0.2.0, 2026-09-05 27
7.12 Version 0.1.0, 2026-09-05 28

Page numbers are filled in when the document is opened in Word, or when it is exported.

1. How to read this

Versions have three numbers: **major.minor.patch**. The first changes when the program changes in a way that needs attention (a new database layout, a new way of working). The second changes when features are added. The third changes for corrections only.

Heading	Meaning
Added	Something the program could not do before.
Changed	Something that works differently than before.
Fixed	Something that was wrong and is now right.
Removed	Something taken out.
Security	A change that affects who can reach or do what.

Updating always keeps your data. The database is upgraded automatically the first time a newer version opens it, after a backup copy is made beside it.

> At the time this document was built, versions 3.0.0, 2.7.1 were committed but not yet tagged and published on GitHub.

2. All releases at a glance

Version	Date	In one line	Added	Changed	Fixed
3.0.0	2026-10-12	Connect to a server	6	1	–
2.7.1	2026-10-11	The Settings tab strip covers the page edge so rows no longer scroll through beside it	–	–	1
2.7.0	2026-10-11	Collections across TV, anime and movies, with Plex's collections read in on each sync and a Sets tab on the family portal	3	–	–
2.6.1	2026-10-11	The MediaLedger logo in the installer, window, browser tab, sidebar, About, request page and family portal	–	1	1
2.6.0	2026-10-08	Content rating and release date from Plex, a Continue watching card, and a full sort menu on the family portal	3	–	–
2.5.0	2026-10-08	The renderer is six files instead of one; no visible change	–	1	–
2.4.2	2026-10-04	The Match and Collect buttons fit their column on the Missing page	–	–	2
2.4.1	2026-10-04	Pick one library on the Missing page, and a larger button to fold the sidebar	1	1	–
2.4.0	2026-09-30	Connect network shares from the web app, a welcome guide, and a guided installer with a sign-in banner on the Pi	3	3	3
2.3.0	2026-09-30	Sort menu on the lists, poster wall details and hover card, sidebar that folds to icons, grouped Settings, HTTPS recognised behind Caddy, clearer family portal check	4	2	1
2.2.0	2026-09-29	Admin sign-in on the family portal for requests, invites, status and jobs from outside the home network	1	–	–
2.1.1	2026-09-28	Editing the dashboard no longer reloads its data on every action, and the dashboard report is served from memory while the library is unchanged	–	–	2
2.1.0	2026-09-28	Posters from Plex, AniList and TVmaze in the lists, title pages, Watch tonight and the family portal, with a poster wall view and a posters folder setting	3	–	1
2.0.1	2026-09-28	The server checks the family portal's addresses on a timer and on demand, with tiles, a Schedules row and notifications; invites need an address first	1	–	2
2.0.0	2026-09-28	Editable dashboard from a card catalog with per-account layouts and editor levels, family portal with invites	6	1	–
1.12.1	2026-09-26	Mount watchdog sees through the automount trap and the reachability check nudges it, HTTPS off switch for reverse proxies, installer honours --port with --update-only, Caddy chapter in the manual	3	–	2
1.12.0	2026-09-18	Reclaim space lists large titles nobody has played, Next up per person on the Watched tab	2	–	–
1.11.0	2026-09-18	Collecting policy per series so long runners stop swamping Missing, episodes filed under Movies flagged on Problems, Plex sync breakdown per library with reasons	3	–	–
1.10.0	2026-09-18	Select next N on the rename tabs, log page, full backup sets with validated restore, overdue job warnings, update notice and optional nightly auto-update on the Pi	5	–	–
1.9.3	2026-09-18	Card tables fit their cards so badges no longer clip, two-column rows stack on mid-width windows, Plex sync timer defaults to 6 hours and is linked from the Plex section	–	1	1
1.9.2	2026-09-17	Schedules section listing every timed job with last and next run and Run now; timed Plex sync independent of scans; configurable snapshot time	2	1	–
1.9.1	2026-09-16	Watched tab with who watched what from Plex play history for every account, charts by person, library, weekday, hour and device, binges and recent plays; upgrade candidates ranked	2	1	–

Version	Date	In one line	Added	Changed	Fixed
1.9.0	2026-09-16	Readable charts on a square-root scale with counts, shares, hover details and drill-down; donut and trend cards from daily snapshots; colour rules with per-account preferences and editor levels; phone layout for cards	3	–	–
1.8.0	2026-09-16	Dashboard and list tiles for tags, genres, sub/dub, watched state, requests, airing and upgrades	1	–	–
1.7.0	2026-09-15	TV and anime renames through the batch engine with pre-flight, journal, undo, dry run and editable name parts	1	–	–
1.6.0	2026-09-15	Upgrades page, airing dates on the Missing page, webhook and e-mail notifications with a daily summary, Home Assistant status endpoint, phone request page	5	–	–
1.5.0	2026-09-15	Watch tonight page, filter dropdowns on the lists, storage forecast, nightly backup to a folder, optional Sub/Dub name part	5	–	–
1.4.0	2026-09-15	Tags on every title: genres from TVmaze, AniList and Plex, sub/dub worked out from the probe, and your own tags	1	–	–
1.3.1	2026-09-15	Editable movie name pattern with clickable parts; installer keeps the admin password on rerun; certificate downloads as .crt	1	–	2
1.3.0	2026-09-15	QR codes for 2FA and guest link, one-click HTTPS, Plex token from XML address, colour themes, zip threshold, one-at-a-time renaming; fix 2FA setup wiped by re-render	7	–	1
1.2.2	2026-09-14	Manual regenerated for accounts, requests, Issues, exports and webhook; fix undefined duplicates tile	–	1	1
1.2.1	2026-09-14	Custom internal domain support in the Pi installer and guide	1	–	–
1.2.0	2026-09-14	Selectable and zipped CSV exports with browser downloads, Plex webhook	4	–	–
1.1.0	2026-09-14	User accounts with admin, standard and guest roles, media requests, merged Issues tab	4	1	–
1.0.4	2026-09-14	Phone table alignment, stacked key-value tables, status dot colour, phone-size screenshot mode	–	1	1
1.0.3	2026-09-14	Phone layout for the web build	1	–	–
1.0.2	2026-09-14	Library root status and diagnostics, background root check, web folder browser, Pi mount watchdog	4	–	–
1.0.1	2026-09-14	Favicon, touch icon and web manifest for the browser build	1	–	–
1.0.0	2026-09-12	Fix desktop preload under sandbox, full manual with System, Security and Raspberry Pi chapters, docs index	4	–	1
0.8.2	2026-09-12	5-second System refresh, video group for Pi throttle flags	–	1	1
0.8.1	2026-09-12	Web About page checks GitHub for a newer release	–	–	1
0.8.0	2026-09-12	System and Security tabs, web-server hardening, server-only package, Raspberry Pi guide	4	2	1
0.7.0	2026-09-12	Web server shell for the Raspberry Pi, shared bridge shape, portable paths	2	4	1
0.6.2	2026-09-12	Stop About page flicker during update download, wrap long runtime values	–	–	2
0.6.1	2026-09-12	Updater re-reads token per check, repo public, readable update errors	–	1	2
0.6.0	2026-09-12	Plex sync with ratings, watched state and a Plex truth source for movie names	3	–	–
0.5.0	2026-09-11	Adult library, web videos, ratings, bulk source and collision tools	4	2	–
0.4.0	2026-09-06	Movie naming engine with journaled, verified, undoable batches	6	2	1
0.3.0	2026-09-05	Missing episodes, duplicate review, quality report, rename tool, folder watch	8	2	2
0.2.0	2026-09-05	Manual fixes	11	3	–

Version	Date	In one line	Added	Changed	Fixed
0.1.0	2026-09-05	Initial release	1	–	–

In total: 130 additions, 33 changes and 33 corrections across 51 releases.

3. The milestones

Version	Date	What it brought
3.0.0	2026-10-12	Connect to a server
2.7.0	2026-10-11	Collections across TV, anime and movies, with Plex's collections read in on each sync and a Sets tab on the family portal
2.6.0	2026-10-08	Content rating and release date from Plex, a Continue watching card, and a full sort menu on the family portal
2.4.0	2026-09-30	Connect network shares from the web app, a welcome guide, and a guided installer with a sign-in banner on the Pi
2.3.0	2026-09-30	Sort menu on the lists, poster wall details and hover card, sidebar that folds to icons, grouped Settings, HTTPS recognised behind Caddy, clearer family portal check
2.1.0	2026-09-28	Posters from Plex, AniList and TVmaze in the lists, title pages, Watch tonight and the family portal, with a poster wall view and a posters folder setting
2.0.0	2026-09-28	Editable dashboard from a card catalog with per-account layouts and editor levels, family portal with invites
1.11.0	2026-09-18	Collecting policy per series so long runners stop swamping Missing, episodes filed under Movies flagged on Problems, Plex sync breakdown per library with reasons
1.10.0	2026-09-18	Select next N on the rename tabs, log page, full backup sets with validated restore, overdue job warnings, update notice and optional nightly auto-update on the Pi
1.9.0	2026-09-16	Readable charts on a square-root scale with counts, shares, hover details and drill-down; donut and trend cards from daily snapshots; colour rules with per-account preferences and editor levels; phone layout for cards
1.6.0	2026-09-15	Upgrades page, airing dates on the Missing page, webhook and e-mail notifications with a daily summary, Home Assistant status endpoint, phone request page
1.5.0	2026-09-15	Watch tonight page, filter dropdowns on the lists, storage forecast, nightly backup to a folder, optional Sub/Dub name part
1.3.0	2026-09-15	QR codes for 2FA and guest link, one-click HTTPS, Plex token from XML address, colour themes, zip threshold, one-at-a-time renaming; fix 2FA setup wiped by re-render
1.2.0	2026-09-14	Selectable and zipped CSV exports with browser downloads, Plex webhook

0.3.0	2026-09-05	Missing episodes, duplicate review, quality report, rename tool, folder watch
0.2.0	2026-09-05	Manual fixes

4. Version 3

1 release, 2026-10-12 to 2026-10-12.

4.1 Version 3.0.0, 2026-10-12

Connect to a server.

A major release: the desktop can be a client of the Pi, duplicates can be moved aside, and collections can be found rather than typed.

Added

- **Connect to a server** (desktop): Settings → Connections → Desktop takes a server address; the desktop application then shows the server's pages instead of its own library, with one database and one set of fixes. Explorer still opens a file's folder through a path mapping (server path → path from this PC). The server's certificate is remembered on first contact, so a changed one is refused rather than accepted silently. A server that does not answer falls back to the local library.
- **Duplicate sweep** (Issues → Duplicates): Keep the best copy everywhere decides every undecided group by resolution, bitrate and size; Move the discards aside moves the discarded files into a `_duplicates` folder at the top of their root, as an undoable batch. Nothing is deleted. Moving needs the renaming switch and your password.
- **Find sets in the library** (Collections): suggestions from the names in the library, from AniList's sequel and side-story links for matched anime, and from Wikidata's "part of the series" for films and shows. All free, no key. One press creates the collection, with placeholders for the titles not owned yet.
- **Subtitle audit** (Issues → Subtitles): files with no subtitle track or tagged sidecar in the wanted languages (Settings → Episodes and quality → Subtitles), by title, with a Find link to OpenSubtitles.
- **Posters on the family portal's request form**: typing a TV or anime title shows matches from TVmaze or AniList with a poster; tapping one fills the form in. Movies stay as typed, since no keyless free source has movie posters.
- **Dashboard cards**: Library health over time and Duplicates and low-bitrate over time (trends from the daily snapshots, schema v15), Collections, and Subtitles.

Changed

- The daily snapshot records duplicates, low-bitrate files, unparsed names, probe errors and the health score, so trends can be drawn from it.

5. Version 2

14 releases, 2026-09-28 to 2026-10-11.

5.1 Version 2.7.1, 2026-10-11

The Settings tab strip covers the page edge so rows no longer scroll through beside it.

Fixed

- The Settings tab strip let rows scroll through the gap above and beside it. It now reaches the page edge and casts a shadow.

5.2 Version 2.7.0, 2026-10-11

Collections across TV, anime and movies, with Plex's collections read in on each sync and a Sets tab on the family portal.

Added

- **Collections** (schema v14): named sets of titles across TV, anime and movies, such as a film series or a shared universe. A new Collections page lists them with a poster strip, how many titles are in the library, total runtime and how many are watched. Open one to see its titles in order, with what is on hand and what is not; add any title from the whole library by typing its name, add a placeholder for one you do not own yet, move titles up and down, order by release date, and keep a note on each.
- **Plex collections come in on each sync**, read only: MediaLedger never writes to Plex. Titles you add to a Plex collection yourself stay through the next sync; a Plex collection whose name matches one of yours gets "(Plex)" after its name.
- The family portal has a **Sets** tab showing the same collections.

5.3 Version 2.6.1, 2026-10-11

The MediaLedger logo in the installer, window, browser tab, sidebar, About, request page and family portal.

Changed

- **A proper icon.** The new MediaLedger logo replaces the square glyph everywhere: the Windows installer and window, the browser tab and phone home screen for the web app, the sidebar, the About page, the request page and the family portal. The icon files are now part of the repository, so release builds carry it too.

Fixed

- **The sidebar did not open on a phone.** A later `.sidebar { position: relative }` rule overrode the drawer's `position: fixed`, so the drawer stayed off screen. The relative rule now applies only on wide screens.

5.4 Version 2.6.0, 2026-10-08

Content rating and release date from Plex, a Continue watching card, and a full sort menu on the family portal.

Added

- **Content rating and release date** from Plex (schema v13): two more entries in the Sort by menu on the TV, Anime and Movies pages, shown on the poster wall's details card. Filled in by the next Plex sync.
- **Continue watching** card for the dashboard (Watching group): titles Plex says are part-way through, with how much is left and when they were last played. Add it with Edit dashboard.
- **Family portal sort menu**: title, rating, year, release date, content rating, date added, last episode added, unwatched, episodes and length, with a button for ascending or descending. Series rows now show their year and content rating.

5.5 Version 2.5.0, 2026-10-08

The renderer is six files instead of one; no visible change.

Changed

- **The renderer is six files instead of one.** `app.js` (2,261 lines) is now `app-core.js`, `views-library.js`, `views-review.js`, `views-maintenance.js`, `views-app.js` and `app-router.js`, loaded in that order. Nothing looks or behaves differently; every page was checked on the desktop and the web build. Each feature from here on lands in one file.

5.6 Version 2.4.2, 2026-10-04

The Match and Collect buttons fit their column on the Missing page.

Fixed

- **Missing page**: the Match and Collect buttons sat in a column wider than they are, leaving an uneven gap beside them. The column now fits its buttons and sits against the right edge.
- The heading of the "Airing next" card no longer wraps into two columns.

5.7 Version 2.4.1, 2026-10-04

Pick one library on the Missing page, and a larger button to fold the sidebar.

Added

- **Missing: pick a library.** A row of buttons (All libraries, TV, Anime) at the top of the page narrows the tiles, the two airing cards and the table to one library, with the number of series with gaps on each button. Only series with gaps hides the complete and unmatched ones. Both are remembered.

Changed

- The button that folds the sidebar is larger.

5.8 Version 2.4.0, 2026-09-30

Connect network shares from the web app, a welcome guide, and a guided installer with a sign-in banner on the Pi.

Added

- **Connect a network share from the web app** (Raspberry Pi / Linux server): Settings → Library → Network shares, and the folder picker, take the file server's address, username and password, list

its shares and connect the ones you tick under `/mnt/medialedger/`. The service still has no root: a root helper started by systemd validates each request and does the mount. The sign-in is kept in a root-only file, never in the settings.

- **Welcome guide** on a new install: connect storage, point at the TV, Anime and Movies folders (or let it find them), check they can be read, start the first scan. Reopen it from Settings → Library.
- **Guided installer on the Pi**: asks for the file server and sign-in, lists its shares, connects the ones you pick, and ends with the address to open. `sudo medialedger-setup` runs the questions again. Signing in over SSH shows whether MediaLedger is running and which shares are connected.

Changed

- The folder picker has a button per connected share, says how many files a folder holds when it has no sub-folders, sorts "Season 2" before "Season 10", and lists up to 2,000 folders instead of 500.
- The installer no longer assumes one particular share; an existing install keeps its `/mnt/media` mount and credentials unchanged.
- The mount watchdog looks after every connected share.

Fixed

- The folder picker showed "No sub-folders" on network mounts that do not report whether an entry is a file or a folder.
- A page that was still loading could paint over the page opened after it.
- The password box on the family portal's admin sign-in was unstyled.

5.9 Version 2.3.0, 2026-09-30

Sort menu on the lists, poster wall details and hover card, sidebar that folds to icons, grouped Settings, HTTPS recognised behind Caddy, clearer family portal check.

Added

- **Sort by** menu on the TV, Anime and Movies pages with an ascending or descending button: title, year, online / audience / critic / own rating, unwatched, last episode added, date added, date viewed, plays, episodes, seasons, duration, size, resolution, bitrate, missing episodes, progress and versions (movies) and Randomly. Remembered per list.
- **Poster wall details**: seasons and episodes (length and quality for a movie) under each title, and a card of details when the pointer rests on a tile.
- **The sidebar folds to icons** with the « button; badges and tooltips stay.
- **Settings in groups** with a tab per group and a Find a setting filter.

Changed

- **HTTPS behind Caddy** no longer shows as a warning: when a reverse proxy on the same machine serves HTTPS, the Security checklist passes and the built-in certificate is not offered.
- **Family portal address check** explains a failed secure connection in words instead of `write EPROTO 6014…`, shows the whole message on the page, and tries a dropped connection a second time before counting it.

Fixed

- Lone checkboxes in Settings and on the Family portal page no longer stretch across the row.

5.10 Version 2.2.0, 2026-09-29

Admin sign-in on the family portal for requests, invites, status and jobs from outside the home network.

Added

- **Admin from outside on the family portal.** With Admin sign-in from outside ticked on the Family portal page, `/admin` signs you in with your admin account (same password, lockout and two-factor code as the web app) and gives you Requests (approve, mark added, decline, reply, delete), Invites (create with link and QR code, new link, revoke, delete) and Status (library numbers, address checks, the Schedules table with Run now, and the two portal options). It is a second short allow-list on the portal, not a way into the web app: settings, renames, folders, files and logs do not exist there, admin sessions are the portal's own (twelve hours, an hour idle) and the switch, port and addresses can only be changed from home. Off by default.

5.11 Version 2.1.1, 2026-09-28

Editing the dashboard no longer reloads its data on every action, and the dashboard report is served from memory while the library is unchanged.

Fixed

- **Editing the dashboard was slow**, badly so on the Raspberry Pi: every move, resize and option change asked the server to recompute the whole dashboard. The editor now draws from the data it already has while you edit and loads fresh when you press Done.
- The dashboard report is answered from memory while nothing in the library has changed (for up to a minute, never during a scan), so opening the Dashboard repeatedly no longer recomputes it.

5.12 Version 2.1.0, 2026-09-28

Posters from Plex, AniList and TVmaze in the lists, title pages, Watch tonight and the family portal, with a poster wall view and a posters folder setting.

Added

- **Posters** for series and movies: thumbnails in the TV, Anime, Movies and Watch tonight lists, a large poster on title pages, and a **poster wall** view of any list that keeps search, filters and sorting. Shown throughout the family portal.
- Sources: Plex first, through its own resizer, then AniList and TVmaze for series Plex does not have. Fetched after each scan and Plex sync, on demand from Settings → Posters, and listed under Schedules. Adult titles are skipped. Schema v12.
- **Posters folder** setting, so a folder on the NAS can serve the desktop app and the web server alike.

Fixed

- The Plex webhook address shows `https://` when the server sits behind a proxy that terminates HTTPS.

5.13 Version 2.0.1, 2026-09-28

The server checks the family portal's addresses on a timer and on demand, with tiles, a Schedules row and notifications; invites need an address first.

Added

- **Family portal address check.** The server opens its public and home address the way a visitor would (DNS, connection, certificate, and the portal identifying itself) every 15 minutes and on demand. Tiles show working / not reachable, response time, up or down since, and certificate days left. Two failures in a row raise a Dashboard notice, a log line and a notification (new event "family portal not reachable"), with one more on recovery. Listed under Settings → Schedules.

Fixed

- Invites can no longer be created before an address is set, which produced an invite with no link or QR code.
- Family portal page: the Save button and the ratings checkbox no longer stretch across the page.

5.14 Version 2.0.0, 2026-09-28

Editable dashboard from a card catalog with per-account layouts and editor levels, family portal with invites.

Added

- **Editable dashboard.** Every element is a card from a catalog of 53 on a six-column grid. Edit mode: drag or ▲ ▼ to move, S / M / L / XL to size, per-card options, Add card, Reset. Layouts are saved per account on the web server (guests see the admin's) and once on the desktop. New cards: next up, plays per day, plays by person, reclaimable space, overdue jobs, storage per month, pending requests over time. The editor comes from the Bracket kit, so it behaves like Linewatch and PiPulse.
- **Options shown** level per account: Simple (title, size), Standard (also period and rows), Advanced (also colour thresholds). Thresholds set with the old tile gear carry over.
- **Family portal.** A second listener (default port 8090, bound to this machine) with its own routes and its own phone-first site: browse the libraries, What to watch tonight, media requests with an "already in the library" check. No sign-in, settings, scans, renames or logs exist there; replies are built from a fixed list of fields and never include paths, Plex keys, watch history, notes or adult titles.
- **Invites** with a link and QR code, optional expiry, per-person permissions, New link and Revoke. Only a hash of each link is stored. Rate limits on browsing, request filing and link guessing; everything is written to the security log.
- Backups include the portal state; restoring accounts restores invites.
- Manual: editing the dashboard, the family portal, Tailscale Funnel.

Changed

- **The visitor's real address behind a reverse proxy.** The server reads `X-Forwarded-For` and `X-Forwarded-Proto`, but only when the connection comes from this machine, so LAN-only, lockouts and the security log work behind Caddy and sign-in cookies are marked Secure over HTTPS.

6. Version 1

24 releases, 2026-09-12 to 2026-09-26.

6.1 Version 1.12.1, 2026-09-26

Mount watchdog sees through the automount trap and the reachability check nudges it, HTTPS off switch for reverse proxies, installer honours --port with --update-only, Caddy chapter in the manual.

Added

- **Turn HTTPS off** on the Security tab, for running behind a reverse proxy. The certificate is kept in `tls-off`.
- The installer honours `--port` together with `--update-only`, rewriting just the service's port.
- Manual: running several services on one Pi with Caddy in front.

Fixed

- **The share mount watchdog never re-mounted.** With `x-systemd.automount` the armed trap counts as a mountpoint, so `mountpoint -q` always said mounted. It now checks the filesystem type, and nudges the automount first.
- **Reachability check nudges an armed automount** before reporting the share as not mounted, so a share that simply has not been touched since boot no longer shows red.

6.2 Version 1.12.0, 2026-09-18

Reclaim space lists large titles nobody has played, Next up per person on the Watched tab.

Added

- **Reclaim space**: large titles nobody on the Plex server has played for 6 to 36 months, or ever, with the space they hold. Read-only; titles rated 4★ or higher are left out.
- **Next up** on the Watched tab: per person and show, the episode after the furthest one watched, how many are left, and whether there is a gap.

6.3 Version 1.11.0, 2026-09-18

Collecting policy per series so long runners stop swamping Missing, episodes filed under Movies flagged on Problems, Plex sync breakdown per library with reasons.

Added

- **Collecting policy per series** (Missing → Collect…): everything, from a season and episode onward, or muted. Counts everywhere follow it; the row keeps a badge with the full number in its tooltip. Schema v11.
- **Episodes filed under Movies** on the Problems page: files in a movie folder whose name carries a season or episode marker.
- **Plex sync breakdown per library**: items, matched, unmatched and the reason, with the first unmatched path as Plex reports it and as translated.

6.4 Version 1.10.0, 2026-09-18

Select next N on the rename tabs, log page, full backup sets with validated restore, overdue job warnings, update notice and optional nightly auto-update on the Pi.

Added

- **Select next N** on both rename tabs: clears the selection and ticks only the next few listed files (10 by default, remembered). "Select shown" asks first above 50.
- **Log page**: the tail of the log with a filter, a problems-only switch, auto-refresh and copy. Admin-only on the web server.
- **Full backups and restore**: each nightly backup is a set (database, settings and, on the web server, the accounts file), pruned together. **Restore…** validates a set read-only, restarts and swaps it in; the files it replaces are kept in a `pre-restore-…` folder. Re-authentication and an audit entry on the web server.
- **Overdue jobs**: a scheduled job that has not run for twice its interval, or a failed backup, is flagged in Schedules, on the Dashboard, in the log and by a daily notification (new event "a scheduled job is overdue").
- **Update notice on the web server**: admins see on the Dashboard when a newer release exists. The installer gains `--auto-update` (nightly systemd timer) and `--no-auto-update`.

6.5 Version 1.9.3, 2026-09-18

Card tables fit their cards so badges no longer clip, two-column rows stack on mid-width windows, Plex sync timer defaults to 6 hours and is linked from the Plex section.

Changed

- The timed Plex sync defaults to every 6 hours (it only runs when a token is set); the Plex section shows the current interval and links to Schedules.

Fixed

- Tables inside cards no longer overflow: on the Missing page the "N missing" badges were cut off by the neighbouring card on mid-width windows. Cards in two-column rows now stack below 1180 px instead of squeezing.

6.6 Version 1.9.2, 2026-09-17

Schedules section listing every timed job with last and next run and Run now; timed Plex sync independent of scans; configurable snapshot time.

Added

- **Settings → Schedules**: every timed job in one table (scan, Plex sync, metadata, backup, snapshot, daily summary) with when it runs, last and next run, and a **Run now** button. The timing controls for backup, snapshot and summary moved here.
- **Timed Plex sync**: an hourly interval independent of scans, so the Watched tab and play counts stay current on days without a scan.

Changed

- The daily snapshot time is configurable (was fixed at 03:05).

6.7 Version 1.9.1, 2026-09-16

Watched tab with who watched what from Plex play history for every account, charts by person, library, weekday, hour and device, binges and recent plays; upgrade candidates ranked.

Added

- **Watched tab**: who watched what, from Plex's server-wide play history (every account, not just the token owner's). Period and person filters, plays / hours / titles / people tiles, charts by person, library, weekday, hour and device, plays-per-day trend, most watched series and movies with who watched them, binge sittings, and a searchable recent-plays list that opens the matched title. Each Plex sync pulls new history; scrobble webhooks add plays in between, with the account name. Schema v10.
- **Upgrade candidates are ranked**: shortfall from 1080p (plus low bitrate) weighted by plays, your stars and the online rating; 4K and HDR copies and never-played unrated titles score 0.

Changed

- The dashboard "Watched" tile opens the Watched tab.

6.8 Version 1.9.0, 2026-09-16

Readable charts on a square-root scale with counts, shares, hover details and drill-down; donut and trend cards from daily snapshots; colour rules with per-account preferences and editor levels; phone layout for cards.

Added

- **Readable charts**: bar charts on a square-root scale with exact counts and shares, hover details with the per-library split, and drill-down (click a bar to open the list filtered to it). Donut cards for anime sub / dub and Plex watched state. Trend cards (files, free space, missing episodes) fed by a new **daily snapshot** taken after each finished scan or at 03:05. Schema v9.
- **Colour rules on number tiles** with shipped defaults and a ⚙ per card; an **editor level** (Simple / Standard / Advanced) per account decides how much the card settings expose. Preferences live per account on the web server (guests see the admin's) and once on the desktop.
- **Phone layout for cards**: one column, number tiles two per row.

6.9 Version 1.8.0, 2026-09-16

Dashboard and list tiles for tags, genres, sub/dub, watched state, requests, airing and upgrades.

Added

- **Dashboard and list tiles for the new data.** Dashboard: Pending requests, Airing this week (next episode named), Watched, Genres known, Your tags, Upgrade candidates, Ended but incomplete, plus Genres, Anime sub / dub and Your tags charts. TV, Anime and Movies lists: Watched, Complete, Sub / dub, Top genres and Your tags tiles. Tiles that summarise a page link to it.

6.10 Version 1.7.0, 2026-09-15

TV and anime renames through the batch engine with pre-flight, journal, undo, dry run and editable name parts.

Added

- **TV and anime renames go through the movie batch engine**: pre-flight of the whole batch, verified renames, a journal in the Batches table on the Rename tab, and **Undo**. Dry run added. Name parts for episodes: the episode title (on by default) plus opt-in Resolution, Codec and Sub/Dub in square brackets, editable by clicking chips or the words in any proposed name.

6.11 Version 1.6.0, 2026-09-15

Upgrades page, airing dates on the Missing page, webhook and e-mail notifications with a daily summary, Home Assistant status endpoint, phone request page.

Added

- **Upgrades** page: every title ranked by how much it deserves a better copy, with plain-English reasons; the scoring function is `src/main/upgrades.js`.
- **Airing next** on the Missing page: the next episode date from TVmaze / AniList per series, this week highlighted, plus Finished airing, still incomplete. Unaired episodes no longer count as missing. Series are re-checked once their expected episode has aired. Schema v8.
- **Notifications** (Settings): a JSON webhook (Home Assistant, ntfy, Discord…) and/or e-mail through a dependency-free SMTP client, for new requests, a daily summary and failed backups, with Send a test.
- **Home Assistant status**: `GET /api/status?key=…` on the web server returns a small JSON summary for a RESTful sensor; key shown and rotated in Settings.
- **Phone request page** at `/request`; the guest QR code now points there.

6.12 Version 1.5.0, 2026-09-15

Watch tonight page, filter dropdowns on the lists, storage forecast, nightly backup to a folder, optional Sub/Dub name part.

Added

- **Watch tonight** page: every series and movie on one list, narrowed by unwatched (Plex), complete series, length, your rating, genre, sub/dub and tag, with Pick for me choosing at random from what is left.
- **Filter dropdowns** on the TV, Anime and Movies lists: genre, sub/dub, your tag, and watched state from Plex.
- **Storage forecast**: a Free on the share tile and a per-month growth panel on the Dashboard, estimating when the share fills at the recent rate.
- **Nightly backup to a folder** (Settings → Data): a dated copy of the database to the NAS once a day, newest N kept, with Back up there now.
- **Sub/Dub name part** for the movie naming engine, off by default: `Sub`, `Dub` or `Dual` from the probed languages.

6.13 Version 1.4.0, 2026-09-15

Tags on every title: genres from TVmaze, AniList and Plex, sub/dub worked out from the probe, and your own tags.

Added

- **Tags** on every series and movie, three kinds: **genres** from the same TVmaze / AniList lookup that fetches episode counts (AniList's ranked tags such as Isekai too; movies take theirs from Plex), **sub / dub** worked out locally from the probed audio and subtitle languages (Subbed, Dubbed, Dual audio, Mixed), and **your own tags** typed on a title page (`kids`, `Christmas`…, suggestions from earlier tags, × to remove). Shown in a Tags column on the lists, matched by the filter box, exported in the series and movie title CSVs, guests read-only. Series matched before this version get their genres filled in once in the background. Schema v7.

6.14 Version 1.3.1, 2026-09-15

Editable movie name pattern with clickable parts; installer keeps the admin password on rerun; certificate downloads as .crt.

Added

- **Editable name pattern** for the movie naming engine: Batch settings → Name parts shows Source, Resolution, HDR/SDR, Codec, [Audio] and {edition} as chips; click one to leave it out of every name, use the arrows to reorder, and the list rebuilds. Every proposed name in the list is made of clickable words that do the same, so clicking `Source` in any row drops it everywhere. Stored as `movieRename.parts`; the `no_source` flag only appears while Source is in use.

Fixed

- **Installer asked for a new web password on every rerun** since 1.1: it looked for the pre-accounts `passwordHash` key. It now checks for an admin account and leaves the password alone.
- The certificate download is named `.crt` instead of `.pem`, so Windows opens its certificate installer on double-click instead of asking for an app.

6.15 Version 1.3.0, 2026-09-15

QR codes for 2FA and guest link, one-click HTTPS, Plex token from XML address, colour themes, zip threshold, one-at-a-time renaming; fix 2FA setup wiped by re-render.

Added

- **QR codes** for the two things people type by hand: the 2FA setup now shows a code to scan with Google Authenticator (or any TOTP app), and when guest access is on the Security tab shows a code for the site address to stick by the TV. Dependency-free encoder (`renderer/qr.js`, byte mode, level M, versions 1–15), verified against a reference decoder.
- **Turn on HTTPS** button on the Security tab: makes a self-signed certificate for every name and LAN address the Pi answers to (including a custom domain), restarts on TLS, keeps sessions, and then offers Download certificate with per-device steps (Windows, Android, iPhone, macOS) to remove the browser warning. A port-80 install moves to 443 with a redirect left on 80. `GET /tls/cert.pem` serves the public half to signed-in users.
- **Plex token from the XML address**: Settings → Plex gains a box to paste the View XML tab's address; the token (and the server URL when it is a LAN address) are pulled out and the pasted text is discarded.
- **Colour themes**: Settings → Appearance with eight palettes (Graphite, Midnight blue, Obsidian, Forest, Rose quartz, Lavender, Gunmetal, Crimson steel), applied at once and remembered per browser (`theme.js` applies it before the first paint).
- **Zip threshold** on the Export tab: Zip the files as well, when at least N files (default 4), so a single-CSV export does not get an archive.
- A **Save** button beside Idle sign-out (same as Save options).
- **One at a time renaming** in both rename tools: a Rename button on every ready row, and One at a time (N) that walks the ticked files through a Rename / Skip / Stop dialog. Each confirmed file is its own batch (same pre-flight, verification and journal), so every step is undoable alone.

Fixed

- **2FA setup vanished on click.** The Set up 2FA handler re-rendered the Security tab as soon as the secret arrived, wiping the secret before it could be entered. The box now stays until the code is confirmed.

6.16 Version 1.2.2, 2026-09-14

Manual regenerated for accounts, requests, Issues, exports and webhook; fix undefined duplicates tile.

Changed

- **User manual regenerated for 1.1 to 1.2.1**: new chapters for Issues (Problems, Fix dialog, Duplicates in one place) and Media requests, the CSV export chapter covers set selection, zip and browser downloads, Plex gains a webhook section, Security opens with accounts and roles (admin, standard, guest) and the Users control, and the Pi chapter covers the `admin` sign-in, `--port=80 --domain=` and the router-side DNS record. PDF refreshed. Screenshot mode now captures the Issues and Requests pages.

Fixed

- The Problems view's Duplicate episodes tile showed "undefined" since the 0.7.0 core split: the core returns a count while the page expected rows. The tile now shows the count and points at the Duplicates button; the redundant duplicate table under Problems is gone.

6.17 Version 1.2.1, 2026-09-14

Custom internal domain support in the Pi installer and guide.

Added

- **Custom internal domain.** `install.sh --port=80 --domain=medialedger.home` serves the Pi on the default web port under your own LAN name; the systemd unit grants the unprivileged service only `CAP_NET_BIND_SERVICE`, the self-signed certificate (with `--https`) is issued for that name, and the domain is remembered for later reruns. The Pi guide (section 7a) explains the router side: UniFi Settings → Routing → DNS → A record, or the equivalent on other routers, Pi-hole or a hosts file, and which name suffix to pick.

6.18 Version 1.2.0, 2026-09-14

Selectable and zipped CSV exports with browser downloads, Plex webhook.

Added

- **Selectable CSV exports.** The Export tab lists the five sets (TV, Anime, Movies, Web videos, Change log) with checkboxes; tick what you need, or save the selection as the default that automatic exports after scans also use.
- **Zip option.** Tick Zip the files as well and every export also produces `medialedger-.zip` (plus `latest/medialedger-latest.zip`). No dependency: a small built-in zip writer.
- **Downloads in the browser.** On the web build the export history links each CSV and zip for download (admin session).
- **Plex webhook** (Plex Pass) on the web server. Settings → Plex → Webhook: enable, copy the URL into Plex Web → Settings → Webhooks. Additions to a Plex library queue a scan two minutes later; watched (scrobble) and rated events update the linked file at once. The key in the URL is the

credential (rotate it with New key), LAN-only still applies, and the last events are shown in Settings. The desktop app reports that webhooks need the server.

6.19 Version 1.1.0, 2026-09-14

User accounts with admin, standard and guest roles, media requests, merged Issues tab.

Added

- **User accounts with roles** on the web server. Sign-in is now username + password. **admin** can do everything; **standard** sees every library and review page, rates titles, files requests and may show adult content for their own session, but gets no settings, system, security, scans, fixes or renames; **guest** (optional, no sign-in) sees library statistics and lists and can file requests, never adult content. The 1.0 password becomes the `admin` account automatically. Security tab → Users: add, change role, reset password, delete; Guest access switch under Options. Two-factor codes apply to admin sign-ins. Standard users see the Plex and GitHub tokens blanked. Every refusal is enforced by the server and written to the audit log.
- **Media requests** tab: anyone may ask for a title (kind, year, note); admins set Pending / Approved / Added / Declined and leave a note. Pending count on the sidebar for admins.
- **Issues** tab merges Problems and Duplicates behind two buttons; the old `#problems` and `#duplicates` links still work.
- Account line in the sidebar with Sign in / Sign out.

Changed

- Adult visibility is per session on the web server instead of one switch for everyone.

6.20 Version 1.0.4, 2026-09-14

Phone table alignment, stacked key-value tables, status dot colour, phone-size screenshot mode.

Changed

- Screenshot mode accepts `--size=WxH` (phone captures), waits for each web page to finish rendering, and keeps the window painting while occluded so captures are never stale.

Fixed

- Phone layout: table headers and rows stayed aligned only by luck in 1.0.3; wide tables now scroll as one unit. Key-value tables (System, About) stack cleanly instead of scrolling sideways. Green status dots on the Security tab were invisible (undefined colour variable).

6.21 Version 1.0.3, 2026-09-14

Phone layout for the web build.

Added

- **Phone layout for the web build.** Below 820 px wide the sidebar becomes a slide-in menu behind a top bar with a Scan button, tiles and panels stack, forms go single-column, wide tables scroll sideways inside their card, and buttons grow to finger size. Nothing changes at desktop width, so the Windows app and the PC browser view are untouched. Also adds the missing viewport meta tag, without which phones rendered the page zoomed out.

6.22 Version 1.0.2, 2026-09-14

Library root status and diagnostics, background root check, web folder browser, Pi mount watchdog.

Added

- **Library root status.** Settings → Library roots shows Reachable / Share not mounted / NAS not answering / Not reachable per root, with entry count and writability, a Check reachability button, and diagnostics: is the NAS answering on the SMB port, is the share in fstab, is it mounted, and the exact command to run.
- **Background root check** (Settings → Check roots every N minutes, default 5): a red counter on Settings and a message the moment a root drops out, and again when it is back.
- **Folder browser on the web build.** The "…" button next to a path now opens a server-side folder picker instead of doing nothing.
- **Pi mount watchdog.** The installer adds a root-owned timer that re-mounts the share within a minute if it dropped and the NAS answers (NAS reboot, Pi moved, network blip). Rerun the installer to get it.

6.23 Version 1.0.1, 2026-09-14

Favicon, touch icon and web manifest for the browser build.

Added

- Favicon in the browser tab, an Apple touch icon and a web-app manifest, so the Pi site shows the MediaLedger icon and can be added to a phone home screen as a standalone app.

6.24 Version 1.0.0, 2026-09-12

Fix desktop preload under sandbox, full manual with System, Security and Raspberry Pi chapters, docs index.

The first stable release. Both shells, the Windows desktop app and the Raspberry Pi web server, share one core, one database format and one manual.

Added

- **User manual** regenerated for 1.0 with new chapters: System, Security, and Running MediaLedger on a Raspberry Pi (requirements, step-by-step install, first run, command reference, security, moving the desktop database, file locations, troubleshooting). Screenshots of the web build included.
- `docs/README.md` index; README gains a Documentation section, System and Raspberry Pi rows in Highlights.
- Pi guide opens with a requirements table, the four commands that do everything, and a command reference.
- Screenshot mode can capture the web build (`--url=http://:8080`).

Fixed

- **Desktop app did not load in 0.7.0 through 0.8.2**: every screen showed "Failed to fetch". The preload script could not load the shared bridge shape inside Electron's sandbox, so the browser bridge took over. The window now runs the preload unsandboxed (context isolation stays on), a test guards it, and the desktop screenshot pass is a release gate. The web server was not affected.

7. Version 0 (before the first stable release)

12 releases, 2026-09-05 to 2026-09-12.

7.1 Version 0.8.2, 2026-09-12

5-second System refresh, video group for Pi throttle flags.

Changed

- System tab samples and refreshes every 5 s instead of 15 s (history still one hour).

Fixed

- Pi throttling / voltage tile was missing: the installer now adds the service user to the `video` group so `vcgencmd` works. Rerun the installer or `sudo usermod -aG video medialedger && sudo systemctl restart medialedger`.

7.2 Version 0.8.1, 2026-09-12

Web About page checks GitHub for a newer release.

Fixed

- Web server: the About page's Check for updates button was greyed out. It now asks GitHub for the latest release and says whether `sudo medialedger-update` has anything to install.

7.3 Version 0.8.0, 2026-09-12

System and Security tabs, web-server hardening, server-only package, Raspberry Pi guide.

Added

- **System tab** (both shells): health verdict with reasons, Raspberry Pi SoC temperature / clock / core voltage / firmware throttling flags, CPU per core, memory and swap, data-disk and per-root free space, network throughput, an hour of in-memory history as sparklines, refreshed every 15 s.
- **Security tab and hardening for the web server**: posture checklist, password change, LAN-only switch (on by default; non-private addresses are refused), idle sign-out, TOTP two-factor codes with in-page setup, session list with revoke, per-address lockout (8 failures / 15 min), password re-entry within 5 minutes for live renames, undo, TV/anime renames, purge and every security change, strict CSP + security headers, audit log (`security.log`), optional HTTPS from `/tls`.
- **Server-only release package** `medialedger-server.tar.gz` (+ `.sha256`), built by CI on every tag: core, renderer, server and installer only, no Electron, no dependencies. `server/install.sh` downloads and verifies it; `medialedger-update` upgrades from it. `--branch=` remains for development, `--https` creates a self-signed certificate.
- `docs/RASPBERRY-PI.md`: the complete Pi guide (hardware, OS, install, first run, daily use, updating, security, moving the desktop database, System tab, troubleshooting, file locations, uninstall).

Changed

- Sign-in dialog has an authenticator-code field (used only when 2FA is on) and a separate re-authentication dialog for sensitive actions.
- The installer silences Node's SQLite experimental warning that used to print over the password prompt.

Fixed

- Pre-0.8 web sessions without an activity timestamp are dropped on upgrade.

7.4 Version 0.7.0, 2026-09-12

Web server shell for the Raspberry Pi, shared bridge shape, portable paths.

Added

- **Web server for the Raspberry Pi (and any Linux box).** `npm run web` / `src/server/server.js` serves the complete app in a browser: same renderer, same tabs, same database format. Zero extra dependencies (node:http), one shared password (scrypt hash, HttpOnly SameSite cookie, login rate limit), same-origin API, server-sent events for scan / metadata / Plex / rename progress. `server/install.sh` sets up Node 22, ffmpeg, the CIFS mount of the share at `/mnt/media`, a hardened systemd service on port 8080 and the `medialedger` / `medialedger-update` commands.
- `renderer/bridge-shape.js` is now the single description of the `window.ledger` API; `preload.js` (IPC) and `renderer/webbridge.js` (HTTP) both build from it.

Changed

- The application core moved out of the Electron entry point into `src/main/service.js`; the desktop shell is now 175 lines. No behaviour change; `test/service.test.js` guards the split and the bridge contract.
- Stored `rel_path` values keep `\` separators on every OS; `paths.absOf()` joins them for the local file system, so a database moves between Windows and the Pi unchanged.
- Default roots on Linux are `/mnt/media/{Movies,Anime,TV_Shows}`.
- ffprobe is found on `PATH` / `/usr/bin` on Linux and macOS.

Fixed

- Series from the adult root are no longer sent to AniList / TVmaze for expected-episode lookups (AniList answered 403 to every one).

7.5 Version 0.6.2, 2026-09-12

Stop About page flicker during update download, wrap long runtime values.

Fixed

- About page no longer flickers while an update downloads: progress updates the status line in place instead of rebuilding the page.
- Long values on the About page (ffprobe path, version banner) wrap inside their card instead of running off the right edge.

7.6 Version 0.6.1, 2026-09-12

Updater re-reads token per check, repo public, readable update errors.

Changed

- The GitHub repository is now public, so the in-app updater works with no token. The token field in Settings → Updates stays as a fallback.

Fixed

- **Check for updates** now re-reads the GitHub token from Settings on every click; before, a token pasted after launch was ignored until a restart.
- Update errors are shown as a short explanation instead of the raw HTTP response (which dumped GitHub's headers and cookies into the panel).

7.7 Version 0.6.0, 2026-09-12

Plex sync with ratings, watched state and a Plex truth source for movie names.

Added

- **Plex integration (phase 2).** Settings → Plex takes the server URL and token, tests the connection, and syncs every movie and show section over the local Plex API (read-only, no Plex account). Each Plex item is linked to a MediaLedger file by path; the path mapping (`/media` → `\nas\share`) is derived automatically from the first match and editable. Stored per file: Plex title, year, rating key, IMDb/TMDB/TVDB ids, your Plex rating, the audience rating, play count, last viewed and resume offset; per show: Plex's own ratings and watched counts. Optional sync after every scan.
- Ratings tab gains Plex audience score, your Plex rating (shown out of 5) and a watched column; series lists show watched percentage and your Plex rating.
- Movie naming engine gets a per-batch truth source: title and year from the file name plus fixes (default) or from the Plex match, with flags when Plex disagrees or a file is not linked.

7.8 Version 0.5.0, 2026-09-11

Adult library, web videos, ratings, bulk source and collision tools.

Added

- **Adult library.** New root type Adult: each file under it is classified as anime, TV or movie from its folder and name and carries an `adult` flag. Hidden from every view, count and query until the "Show adult content" switch in the sidebar is on (it resets on every launch); an Adult tab with its own dashboard, series and movie lists appears while it is on. Left out of CSV exports unless allowed in Settings. All the usual tools (Fix…, Match…, ratings, quality, duplicates) work on adult files.
- **Web videos.** New root type Web videos for yt-dlp style downloads: channel from the folder, title from the file name with `[videoId]` and dates stripped. Web videos tab grouped by channel with a per-channel video list, YouTube links where an id exists, and a `web_videos.csv` export.
- **Ratings.** Online averages from TVmaze and AniList are stored during the episode-count lookup (no extra requests). A local 0–5 star rating and note per title for TV, anime, movies and web channels. New Ratings tab, rating columns on the series lists, and `online_rating` / `my_rating` / `my_note` columns in the series and movie CSVs. Plex user ratings are queued for the Plex integration.
- **Movie names:** bulk "Set source for selected" (Web / Rip / clear) so the 800-odd `Source` placeholders can be cleared in a few passes; a Name collisions section that shows the files behind each collision with "Keep this, ignore others"; a pinned Placeholders on disk section listing files already renamed with `(Year)` or `Source` that still need a value.

Changed

- Parser version 3: the whole database is re-parsed on first launch so existing rows gain the adult flag and web fields.

- Sidebar regrouped: Web videos and Adult under Library, Ratings under Review.

7.9 Version 0.4.0, 2026-09-06

Movie naming engine with journaled, verified, undoable batches.

Added

- **Movie naming engine** (new Movie names tab). Builds `Title (Year) - Source Resolution HDR Codec [Audio] [{edition-…}].ext` from the parsed title/year and manual fixes plus **probed** resolution, colour range, codec and audio language. Source is Web for LiLTV / WEB markers, Rip for BRrip / BluRay / Remux / DVD markers, or a manual fix. Anything the probe cannot prove becomes a placeholder word (`Year`, `Source`) for the owner to fill in; files without a probe, without a title, or whose proposed name would collide are blocked and never renamed.
- Batch executor with the full safety model: dry run by default, a per-tab "Allow live renames" switch plus a typed RENAME confirmation, whole-batch pre-flight (source exists, size unchanged since scan, target free, root writable, path length) that aborts everything on one failure, post-rename size verification before the database is updated, a journal of every item, and per-batch Undo that re-checks each file before restoring it.
- Two layouts per batch: rename in place (atomic) or move into `Title (Year)` folders using copy → verify size and head/tail hash → delete.
- Exclusive lock while a live batch runs: scans and the folder watcher back off.
- Batch size limit as a tab setting; Fix dialog gains a Source field for movies.
- `test/movieNamer.report.js` dry report over a whole database (CSV).

Changed

- The generic rename tool now covers TV and anime only; movies use the engine.
- Missing-episode lists collapse whole missing seasons into ranges ("S6–S38 entirely") instead of listing every number.

Fixed

- Duplicate "keep" marks and manual Source choices are preserved when a file is re-fixed through the Fix dialog.

7.10 Version 0.3.0, 2026-09-05

Missing episodes, duplicate review, quality report, rename tool, folder watch.

Added

- **Missing episodes.** Expected episode counts per season are fetched from TVmaze (TV) and AniList (anime) — both free, no key — in the background after each scan. New Missing episodes page, a Missing column on the series lists, a per-season episode grid on the series page, dashboard tiles, and `expected_episodes` / `missing_episodes` / `missing_list` columns in the series CSVs. A Match… dialog lets you search either source, pick the right entry, enter counts by hand, or mark a series as having none; those choices are locked and never overwritten. AniList split-cour "Part 2" entries are merged into their season; ongoing series count aired episodes; absolute numbering on disk is detected and skipped rather than reported as missing.
- **Duplicate review.** New Duplicates page shows every season/episode that exists as several files side by side (size, length, resolution, bitrate, codec, HDR, audio, subtitles) with the best-quality

candidate flagged. Mark one as Keep; the decision is remembered across scans. Nothing is deleted.

- **Quality report.** New Quality page: series and seasons that mix resolutions, files below a per-resolution bitrate threshold (editable in Settings), files with no audio track, undefined audio language, and files under two minutes. `mixed_resolution` and `low_bitrate_files` columns in the series CSVs.
- **Rename tool (opt-in, off by default).** New Rename files page proposes Plex-standard names (`Show - S01E02 - Title.ext`, `Title (Year) - Edition.ext`) from the parsed details and manual fixes. Tick the files, confirm, and they are renamed in place — never moved, never overwritten — with every attempt logged. The only feature that writes to the share; gated by a setting.
- **Folder watch (setting).** Windows change notifications on each root start a scan once the folder has been quiet for a configurable number of seconds.
- Automatic re-parse of the whole database when parser rules change (26 → 4 unparsed files on the reference library without a rescan).
- `--screenshots=` and `--social=WxH` modes for README images; `--profile=` to run a second copy against a separate data folder.
- README: badges, screenshot gallery, scan timings, CSV reference, privacy notes, FAQ and roadmap.

Changed

- Dashboard: "Season gaps" panel replaced by "Most missing episodes"; new tiles for missing episodes, duplicates, mixed quality, low bitrate, undefined audio language and folder watch. Audio-language chart labels `und` as "undefined".
- Sidebar regrouped into Library / Review / Maintenance / App with counters on Missing episodes, Duplicates and Problems.

Fixed

- Scan-history average duration no longer counts scans from before the column existed.
- Database migrations strip SQL comments before splitting statements (a comment containing a semicolon broke the v2 upgrade).

7.11 Version 0.2.0, 2026-09-05

Manual fixes.

Added

- Manual fixes: a **Fix…** button on every episode, movie file and Problems row opens a form to correct series, season, episode, title, year or edition, or to ignore a file. Fixes are stored in the database and re-applied on every scan.
- Multi-threaded directory listing (worker threads, on by default, toggle and thread count in Settings). Full TV root: 2 min 40 s instead of ~12 min; rescan with nothing changed: 3 s.
- Problems view now also lists duplicate episodes, ignored files and saved fixes, with a summary strip at the top; the sidebar shows an open-problem count.
- Change log summary strip and a 30-day activity chart above the list.
- Dashboard: audio/subtitle language, frame rate, dynamic range and audio codec breakdowns, library health, below-720p count, average bitrate, recently added, largest movie files, season gaps and scan history panels.

- CSV export moved to its own tab with history, row counts and open-folder buttons.
- About page with version, runtime, ffprobe, data folder, credits and a **Check for updates** button; silent auto-update from GitHub Releases for the installed app (electron-updater).
- ffmpeg auto-download: when no ffprobe is found the app fetches the latest static Windows build from BtbN's FFmpeg-Builds into its data folder on first launch; a manual download button lives in Settings.
- Database schema versioning with automatic pre-migration backups, a manual backup button, and a Data section in Settings explaining where everything lives.
- Scan duration and thread count recorded per scan; probe rate and ETA shown while scanning.
- Windows installer (NSIS one-click, per-user) built by CI on tag push.

Changed

- Default ffprobe concurrency raised from 4 to 8.
- Quieter scrollbars, tighter table spacing, uppercase column headers, wrapping path cells.
- Parser understands `2Show S3.mp4` (number glued to the title), `Title_-_01_720p_Group.mp4`, `Show - OVA.mp4` and `Special 01 - Title.mp4` (season 0).

7.12 Version 0.1.0, 2026-09-05

Initial release.

Added

- Initial release: Electron desktop app that walks the TV, Anime and Movies shares, probes files with ffprobe, stores results in SQLite, exports CSVs, keeps a change log, and schedules scans via an in-app timer or Windows Task Scheduler.
